

# Simultaneous Reconstruction of the Activity Image and Registration of the CT image in TOF-PET

Ahmadreza Rezaei, Johan Nuyts

# Activity Reconstruction & Attenuation Registration

## – Attenuation Correction, Background

- In clinical PET/CT,
  - The CT image is adjusted to the photon energy of 511 KeV.
  - The projections of the “adjusted CT” is then used for attenuation correction.
  - This “adjusted CT” is believed to be close enough to the true attenuation affecting the PET emission data.
    - Between-scan motion and in-scan motion can violate this assumption.
- The emission data can be corrected for attenuation:
  - When the emission data is affected by an affine transform of a known attenuation image.
    - F Natterer, 1993
    - A Welch, *et. al.*, 1998, A Bromiley 2001
    - A Alessio, *et. al.*, 2006
  - Time-of-flight data are available
    - A Rezaei, 2011, 2012
    - M Defrise, 2012, 2013
    - Y Nuyts, 2012

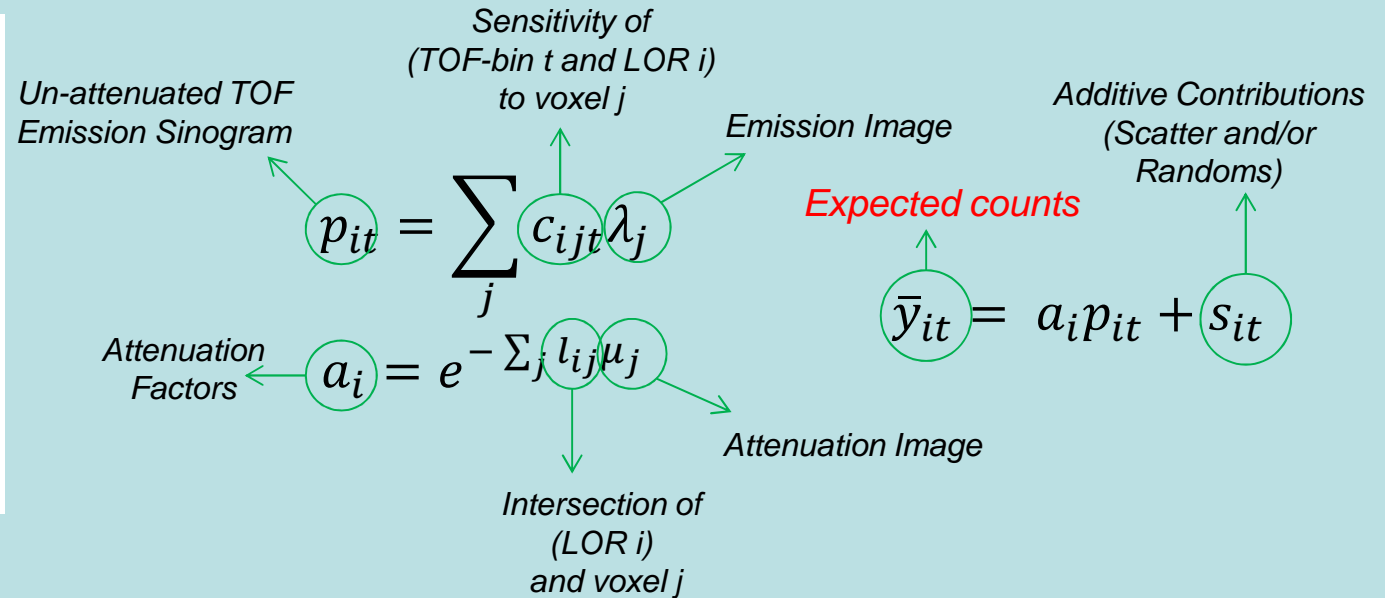

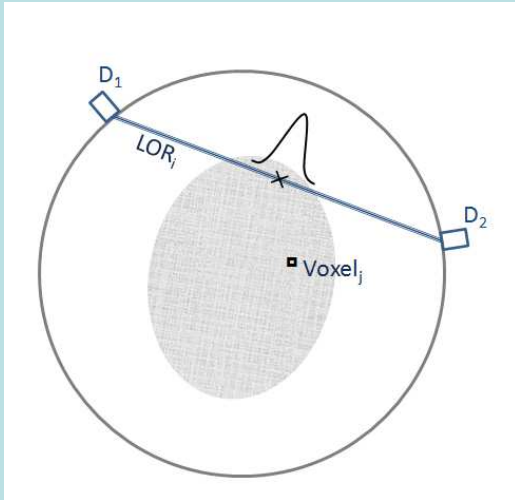

# Joint Activity and Attenuation Reconstruction

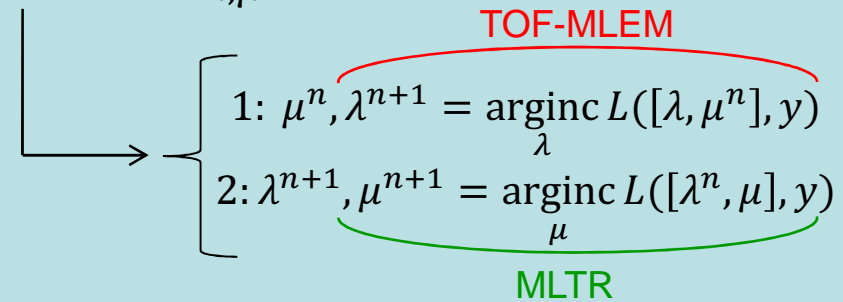

– MLAA

Poisson Log-likelihood for emission tomography:

$$L([\lambda, \mu], y) = \sum_{it} y_{it} \ln \bar{y}_{it} - \bar{y}_{it}$$

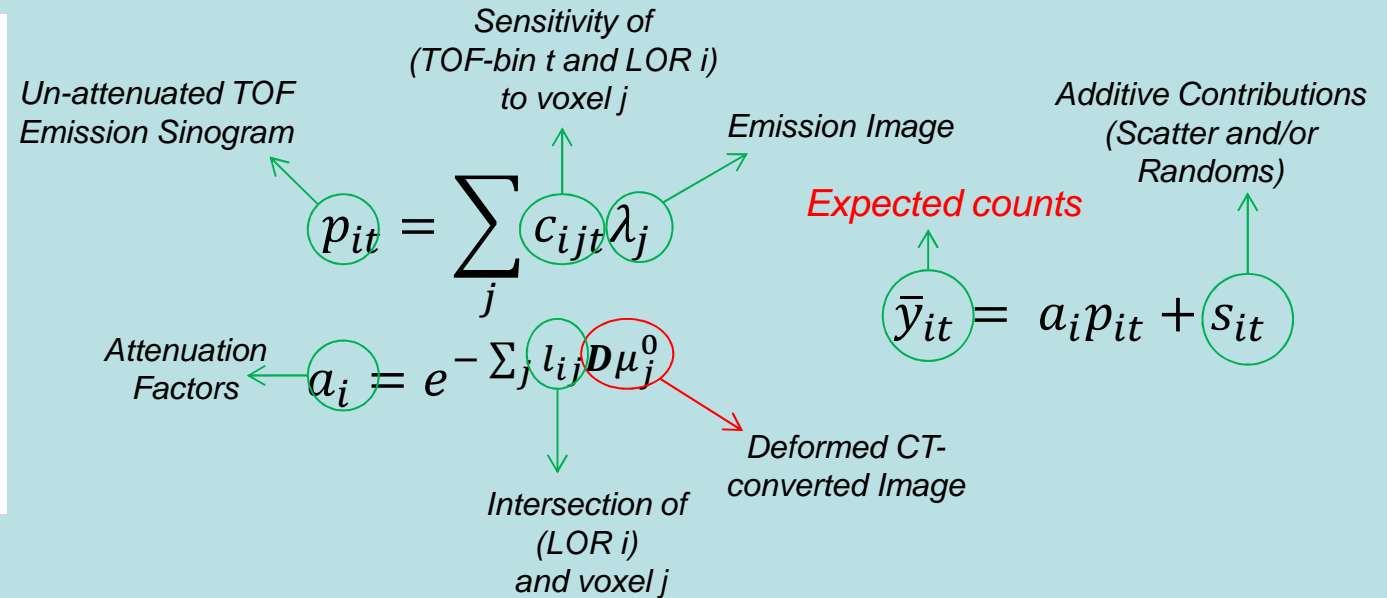

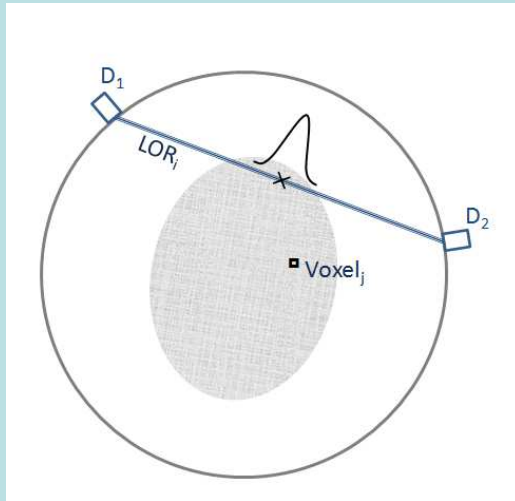

$$[\hat{\lambda}_{mle}, \hat{\mu}_{mle}] = \underset{\lambda, \mu}{\operatorname{argmax}} L([\lambda, \mu], y)$$

# Activity Reconstruction & Attenuation Registration

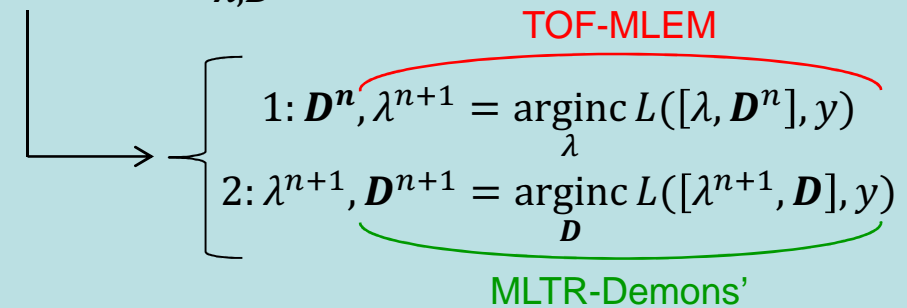

– Incorporating “side-information”

Poisson Log-likelihood for emission tomography:

$$L([\lambda, \mathbf{D}], y) = \sum_{it} y_{it} \ln \bar{y}_{it} - \bar{y}_{it}$$

$$[\hat{\lambda}_{mle}, \hat{\mathbf{D}}_{mle}] = \underset{\lambda, \mathbf{D}}{\operatorname{argmax}} L([\lambda, \mathbf{D}], y)$$

# Activity Reconstruction & Attenuation Registration

## – MLRR

- MLRR Algorithm:

TOF-MLEM

$$\lambda_j^n = \frac{\lambda_j^{n-1}}{\sum_{it} c_{ijt} a_i^{n-1}} \sum_{it} c_{ijt} a_i^{n-1} \frac{y_{it}}{\bar{y}_{it}}$$

Update of MLTR

$$\Delta\mu = \frac{\sum_i l_{ij} (\bar{y}_i - y_i)}{\sum_i l_{ij} y_i \sum_k l_{ik}}$$

Demons' Registration

$$\mathbf{D}^n = \mathbf{D}^{n-1} + k \frac{(\Delta\mu) \nabla\mu}{(\nabla\mu)^2 + \alpha(\Delta\mu)^2}$$

- Non-rigid
- Optical flow
- Regularized

$$\mu_j^n = \mathbf{D}^n \mu_j^0$$

CT deformation

Optical Flow Equation:

$$-(M - F) = \mathbf{D} \cdot \nabla F$$

*Moving Image*
*Fixed Image*

Projection on  $\nabla F$

$$\mathbf{D} = \frac{-(M - F) \nabla F}{\|\nabla F\|^2}$$

To stabilize  $\mathbf{D}$

$$\mathbf{D} = \frac{-(M - F) \nabla F}{\|\nabla F\|^2 + \alpha(M - F)^2}$$

# 2D Simulations

– *Phantom & Demons' Registration Method*

# 2D Simulations

– *Noiseless data*

- Simulation specifications:
  - 200\*200 thorax phantom
  - 168 projection angles over 180°
  - TOF resolution of 580ps
  - 13 TOF-bins of 312ps
  - Oversampling of 3 causing slight mismatch

# Conclusions & Future Work

- MLRR is proposed to make use of high quality CT scans.
- Our 2D/3D simulations indicate:
  - MLRR is able to produce aligned activity and attenuation reconstructions similar to MLAA, with two advantages:
    - The scale problem is solved!
    - High quality, noise-free attenuation reconstructions are made available.
- The clinical results show:
  - Good agreement of MLRR attenuation reconstructions and expected breathing patterns.
  - More accurate activity reconstructions near boundaries affected by motion (compared to MLEM activity reconstructions with the CT-derived attenuation).
- Future Work:
  - Incorporate physical properties of different tissue types.
  - Because the emission data from a moving attenuation is inconsistent, analyzing the gated reconstructions seems to be the only way to quantitative reconstruction in the presence of motion.

- Our thanks to:
  - **Michel Defrise** from the Vrije Universiteit Brussel, and **Annemie Ribbens** from KU Leuven for the very insightful discussions.
  - **Mike Casey, Judson Jones** from Siemens Healthcare, Molecular Imaging for the data-based gating software and data processing.
  - **S Stroobants, S Staelens** and **M Lambrechts** from the Universiteit Antwerpen for the patient data.
  - **You!** for your attention. 😊
