PART 1 Backgrounds and fundamentals of reduced order models

CHAPTER 1 An introduction to model order reduction techniques.....	3
<i>Alberto Badías, David González, Icíar Alfaro, Francisco Chinesta, and Elías Cueto</i>	
1.1 Introduction.....	3
1.2 A posteriori model order reduction.....	3
1.3 A geometric interpretation of POD.....	5
1.4 Towards an a priori MOR technique: the reduced basis approach.....	7
1.5 The proper generalized decomposition.....	7
1.5.1 Computation of $S(\mathbf{s})$ assuming $R(\mathbf{x})$ is known.....	8
1.5.2 Computation of $R(\mathbf{x})$ assuming $S(\mathbf{s})$ is known.....	9
1.6 PGD for non-linear problems.....	9
1.7 PGD for hyperelasticity problems.....	12
1.8 Nonintrusive model order reduction.....	14
1.9 Data assimilation in a reduced-order context.....	16
1.10 Conclusions.....	18
References.....	19
CHAPTER 2 Linear and nonlinear dimensionality reduction of biomechanical models.....	23
<i>Alba Muixí, Alberto García-González, Sergio Zlotnik, and Pedro Díez</i>	
2.1 Introduction.....	23
2.2 Principal Component Analysis (PCA).....	24
2.2.1 Diagonalizing the covariance matrix.....	24
2.2.2 Reducing the dimension.....	25
2.2.3 Singular-Value Decomposition (SVD): an alternative to diagonalization.....	26
2.2.4 Permuting d and n_s	27
2.2.5 Equivalence of diagonalizing \mathbf{C} and \mathbf{G}	27
2.3 Kernel Principal Component Analysis.....	28
2.3.1 The kernel trick.....	29
2.3.2 kPCA forward mapping. Diagonalization and dimensionality reduction.....	31

2.3.3	kPCA backward mapping: from \mathbf{z}^* to \mathbf{x}^*	32
2.4	Proper Orthogonal Decomposition.....	34
2.5	Kernel Proper Orthogonal Decomposition.....	35
2.5.1	Optimal solution for a given \mathbf{z}	35
2.5.2	Exploration of the reduced space.....	36
2.5.3	kPOD algorithm.....	37
2.6	Numerical test: advection–diffusion problem in a bifurcation domain.....	39
2.6.1	Model and parameterization.....	39
2.6.2	Dimensionality reduction: PCA and kPCA.....	40
2.6.3	ROM computations: POD and kPOD.....	42
2.7	Closure.....	42
	Acknowledgments.....	43
	References.....	43
CHAPTER 3	Shape parameterizations for reduced order modeling in biophysics	45
	<i>Nathan Lauzeral and Domenico Borzacchiello</i>	
3.1	Motivations and background.....	45
3.2	Related work.....	47
3.2.1	Choice of the anatomical atlas.....	47
3.2.2	The use of anatomical atlases with reduced order models.....	48
3.3	From images to shape parametric reduced order models.....	49
3.3.1	Creating a registered shape dataset.....	50
3.3.2	From the shape to the model.....	53
3.3.3	Dimensionality reduction through statistical shape analysis.....	55
3.4	Using shape atlases with the sparse subspace learning technique.....	57
3.4.1	Parametric boundaries definition.....	58
3.4.2	Choice of the parametric basis functions.....	58
3.5	Conclusions and perspectives.....	59
	References.....	60
CHAPTER 4	Data-driven modelling and artificial intelligence	65
	<i>Francisco Chinesta, Nicolas Hascoet, and Elías Cueto</i>	
4.1	Introduction.....	65
4.2	Data.....	66
4.2.1	Data and its metrics.....	66
4.2.2	Dimensionality reduction by using manifold learning.....	68
4.2.3	Dimensionality reduction by using autoencoders.....	70
4.3	Data clustering and classification.....	73
4.3.1	k -means.....	73
4.3.2	Support vector machines, SVMs.....	74
4.3.3	Decision trees & random forests.....	74

4.3.4	Boosting algorithms.....	75
4.4	Advanced regression.....	76
4.4.1	Neural networks.....	76
4.4.2	Code2Vect.....	88
4.4.3	Sparse identification for nonlinear dynamical systems, SINDy.....	89
4.4.4	Sparse PGD based regressions (sPGD).....	89
4.4.5	Dynamic mode decomposition, DMD.....	91
4.5	Conclusions.....	92
	References.....	92
CHAPTER 5	Deep learning for real-time computational biomechanics.....	95
	<i>Andrea Mendizabal, Alban Odot, and Stéphane Cotin</i>	
5.1	Introduction.....	95
5.2	State of the art.....	96
5.3	Deep neural networks for mechanical simulation.....	99
5.3.1	The problem to be solved.....	99
5.3.2	The choice of the network architecture.....	102
5.3.3	Synthetic training data generation.....	104
5.3.4	Minimization of a loss function.....	107
5.4	Results on three synthetic scenarios.....	107
5.4.1	Simple metrics.....	108
5.4.2	Cantilever beam.....	108
5.4.3	Armadillo.....	111
5.4.4	Human liver.....	113
5.5	Discussion.....	116
5.6	Conclusion.....	118
	Appendix 5.A Supplementary material.....	119
	References.....	123
CHAPTER 6	An introduction to POD-greedy-Galerkin reduced basis method....	127
	<i>Pierfrancesco Siena, Michele Girfoglio, and Gianluigi Rozza</i>	
	Abbreviations.....	127
6.1	Introduction and motivation.....	127
6.2	Parametrized differential equations.....	128
6.2.1	Parametric weak formulation.....	129
6.2.2	Well-posedness of the problem.....	129
6.2.3	Discretization of the weak formulation.....	130
6.3	Reduced order model.....	131
6.3.1	Reduced approximation.....	131
6.3.2	Reduced basis generation.....	133
6.3.3	Notes on the affine decomposition.....	136
6.4	Error analysis.....	137

6.4.1	Error representation.....	137
6.4.2	Error bounds.....	138
6.5	Conclusions.....	142
	Acknowledgments.....	142
	References.....	142
CHAPTER 7	Machine learning and biophysical models: how to benefit each other?.....	147
	<i>Nicolas Duchateau and Oscar Camara</i>	
	Abbreviations.....	147
7.1	Introduction.....	147
7.2	Machine learning as a support for biophysical models.....	150
7.2.1	Accelerating computations in biophysical models.....	150
7.2.2	Estimating unobservable parameters with biophysical models.....	154
7.2.3	Examining the outputs of simulations.....	155
7.3	Biophysical models as a support for machine learning.....	156
7.3.1	Constraining machine learning algorithms with physiologically relevant knowledge.....	156
7.3.2	Synthetic data generation for training and validation of machine learning algorithms.....	157
7.4	Conclusions.....	160
	Acknowledgments.....	161
	References.....	161
PART 2 Applications to computational fluid biomechanics		
CHAPTER 8	Fast and accurate numerical simulations for the study of coronary artery bypass grafts by artificial neural networks.....	167
	<i>Pierfrancesco Siena, Michele Girfoglio, and Gianluigi Rozza</i>	
	Abbreviations.....	167
8.1	Introduction.....	167
8.2	Full order model.....	168
8.2.1	Navier–Stokes equations.....	168
8.2.2	Time and space discretization.....	169
8.2.3	Computational domain.....	170
8.3	Reduced order model.....	172
8.3.1	POD–ANN approach.....	172
8.3.2	State of the art.....	174
8.4	Numerical results.....	175
8.5	Perspectives and conclusions.....	178
	Acknowledgments.....	180
	References.....	180

CHAPTER 9	Reduced order models for fluid inside aneurysms using proper orthogonal decomposition	185
	<i>Yahya Modarres-Sadeghi</i>	
9.1	Introduction.....	185
9.2	Reduced order modeling by proper orthogonal decomposition.....	187
9.2.1	Snapshot proper orthogonal decomposition (POD).....	187
9.2.2	POD-based ROMs with multiple time-dependent boundary conditions..	188
9.3	The training CFD run.....	189
9.4	Constructing the ROM.....	189
9.5	Comparison with independent CFD runs.....	190
9.6	Using the ROM—the influence of the inflow angle in an AAA.....	192
9.7	Conclusions.....	192
	References.....	193
CHAPTER 10	Isogeometric hierarchical model reduction for advection–diffusion process simulation in microchannels	197
	<i>Simona Perotto, Gloria Bellini, Francesco Ballarin, Karol Calò, Valentina Mazzi, and Umberto Morbiducci</i>	
10.1	Introduction.....	197
10.2	Advection–diffusion problems in a microchannel.....	198
10.3	Numerical modelling using HiMod reduction.....	200
10.3.1	Geometric characterization of the computational domain.....	200
10.3.2	The discrete HiMod space.....	201
10.3.3	The HiMod algebraic formulation.....	203
10.4	Numerical results and discussion.....	205
10.5	Conclusions and perspectives.....	208
	Acknowledgments.....	209
	References.....	210
CHAPTER 11	Fast closed-loop CFD model for patient-specific aortic-dissection management	213
	<i>Jacques Tomasi, Clémentine Shao, Mathieu Lederlin, Jean Philippe Verhoye, Michel Rochette, and Pascal Haigron</i>	
	Abbreviations.....	213
11.1	Introduction.....	214
11.2	Related studies.....	215
11.3	Closed-loop CFD.....	216
11.3.1	3D-geometry and meshes.....	217
11.3.2	Closed-loop 0D model.....	218
11.3.3	3D patient-specific CFD.....	220
11.4	Dynamic ROMs.....	221
11.4.1	Overview.....	221

11.4.2	ROMs computation.....	222
11.4.3	Clinical scenarios.....	223
11.5	Results.....	224
11.5.1	0D dynamic ROM.....	224
11.5.2	Coupled 0D dynamic ROM.....	224
11.5.3	3D ROMs.....	224
11.5.4	Clinical scenario.....	228
11.6	Conclusion.....	230
	Acknowledgments.....	230
	References.....	231
CHAPTER 12	Reduced order modelling for direct and inverse problems in haemodynamics.....	235
	<i>Damiano Lombardi</i>	
12.1	Introduction.....	235
12.2	Background.....	236
12.3	Physics reduction-based ROMs.....	238
12.3.1	Direct problems.....	238
12.3.2	Inverse problems.....	240
12.4	Projection-based ROMs.....	240
12.4.1	Direct problems.....	243
12.4.2	Inverse problems.....	243
12.5	Data-driven-based ROMs.....	244
12.5.1	Direct problems.....	244
12.5.2	Inverse problems.....	245
12.6	Conclusion.....	246
	References.....	246

PART 3 Applications to computational solid biomechanics and living tissues

CHAPTER 13	Model order reduction of a 3D biomechanical tongue model: a solution for real-time movement simulations to study speech motor control.....	257
	<i>Maxime Calka, Pascal Perrier, Christelle Grivot-Boichon, Michel Rochette, and Yohan Payan</i>	
	Abbreviations.....	257
13.1	Introduction.....	257
13.2	State of the art.....	259
13.3	Materials & methods.....	260
13.3.1	Machine learning based model order reduction.....	260
13.3.2	Learning phase: ROM building.....	260

13.4	Biomechanical model of the tongue and simulation data.....	262
13.5	Results.....	265
13.6	Discussion and conclusion.....	266
	Appendix 13.A Some details on the DRB method (from Calka et al., 2021).....	267
	References.....	269
CHAPTER 14 Deep learning contributions for reducing the complexity of prostate biomechanical models..... 271		
	<i>Oscar J. Pellicer-Valero, Maria José Rupérez, Victor Gonzalez-Perez, and José D. Martín-Guerrero</i>	
	Abbreviations.....	271
14.1	Introduction.....	272
14.2	State of the art.....	273
14.3	Materials and methods.....	274
	14.3.1 Data preprocessing.....	274
	14.3.2 Prostate segmentation with convolutional neural networks.....	275
	14.3.3 Meshing and surface registration with coherent point drift.....	277
	14.3.4 Mechanical simulation with finite element method.....	278
	14.3.5 Dense deformation field estimation with a convolutional neural network.....	280
14.4	Results.....	284
14.5	Discussion.....	285
	Funding.....	288
	Institutional review.....	288
	References.....	288
CHAPTER 15 Reduced mechanical models of trunk–lumbar belt interaction for design-oriented in-silico clinical trials..... 293		
	<i>Aicha Errabity, Fanette Chassagne, Paul Calmels, Woo-Suck Han, Romain Pannetier, Rébecca Bonnaire, and Jérôme Molimard</i>	
15.1	Introduction.....	293
15.2	Material and methods.....	294
	15.2.1 Method overview.....	294
	15.2.2 Lumbar belt.....	295
	15.2.3 Cohort.....	295
	15.2.4 Numerical model.....	298
	15.2.5 Mechanical analysis.....	300
	15.2.6 Statistical methods.....	301
15.3	Results.....	301
	15.3.1 Generated in-silico cohort.....	301
	15.3.2 Trunk–belt interactions.....	303
15.4	Discussion.....	305
	15.4.1 Aims.....	305

15.4.2	Main findings.....	305
15.4.3	Validity of the mathematical models.....	305
15.4.4	Limitations.....	306
15.5	Conclusion.....	306
	Acknowledgments.....	307
	References.....	307
CHAPTER 16 ROM-based patient-specific structural analysis of vertebrae affected by metastasis.....		309
<i>Xavier Garcia-Andrés, Enrique Nadal, Estanislao Arana, Blai Gandía-Vañó, and Juan José Ródenas</i>		
16.1	Introduction.....	309
16.2	Methodologies.....	311
16.2.1	Cartesian grid finite element method— <i>cgFEM</i>	312
16.2.2	Sparse subspace learning—SSL.....	315
16.3	Technologies.....	315
16.3.1	FEM model.....	315
16.3.2	Tumor parametrization.....	316
16.3.3	Workflow.....	318
16.4	Results.....	319
16.4.1	Variation of tumor density.....	319
16.4.2	Variation of the radius of the tumor.....	320
16.4.3	Variation of all parameters.....	320
16.5	Conclusions.....	324
	Acknowledgments.....	324
	References.....	324
CHAPTER 17 Reduced order model for prediction of a successful course of vaginal delivery.....		327
<i>Luděk Hynčák, Hana Čechová, Linda Havelková, Magdalena Jansová, Ladislav Krofta, Martin Němec, and Vladimír Kališ</i>		
	Abbreviations.....	327
17.1	Introduction.....	327
17.1.1	Pelvic floor disorder.....	328
17.1.2	Anatomy of the pelvic floor and perineum.....	328
17.1.3	Biomechanics of vaginal delivery.....	331
17.2	Mathematical background.....	331
17.2.1	Reference model.....	331
17.2.2	Reduced-order modeling.....	334
17.3	State of the art.....	336
17.3.1	Pelvic floor modeling.....	336
17.3.2	Reduced order modeling.....	337

17.4	Design of experiment.....	338
17.4.1	Design models.....	338
17.4.2	Numerical simulation.....	339
17.4.3	Response surface.....	341
17.5	Results.....	341
17.6	Discussion.....	344
	Acknowledgments.....	346
	References.....	346
CHAPTER 18	Modeling and simulation of a realistic knee joint using biphasic materials by means of the proper generalized composition.....	349
	<i>Chady Ghnatios and Ilige Hage</i>	
18.1	Introduction.....	349
18.2	Background on the use of the PGD for the solution of Brinkman equations.....	351
18.3	State of the art.....	352
18.4	Description of the simulation approach.....	354
18.4.1	Dimensions of the knee joint.....	354
18.4.2	The PGD simulation.....	356
18.5	Results.....	357
18.6	Discussion and conclusion.....	358
	References.....	359
CHAPTER 19	Comparison of three machine learning methods to estimate myocardial stiffness.....	363
	<i>Rana Raza Mehdi, Emilio A. Mendiola, Adam Sears, Gaurav Choudhary, Jacques Ohayon, Roderic Pettigrew, and Reza Avazmohammadi</i>	
19.1	Introduction.....	363
19.2	Materials and methods.....	365
19.2.1	Animals models and image reconstruction.....	365
19.2.2	Mechanical model.....	365
19.2.3	Cardiac database development using LHS.....	366
19.2.4	Machine learning inputs.....	367
19.2.5	Machine learning models.....	367
19.2.6	Training machine learning models.....	370
19.2.7	Feature importance analysis.....	371
19.3	Results.....	372
19.3.1	Predictive performance of ML models.....	372
19.3.2	Feature importance.....	373
19.4	Discussion.....	377
	Declaration of competing interest.....	379
	Data availability.....	379
	Acknowledgments.....	379

References.....	380

PART 4 Applications to biomechanical electrophysiology, image processing, and surgical protocols

CHAPTER 20 Real-time numerical prediction of strain localization using dictionary-based ROM-nets for sitting-acquired deep tissue injury prevention.....	385
<i>Pierre-Yves Rohan, Nolwenn Fougeron, Bethany Keenan, H�el�ene Pillet, S�ebastien Laporte, Nikolay Osipov, and David Ryckelynck</i>	
20.1 Introduction.....	385
20.2 Previous work and existing digital twins.....	387
20.2.1 Participants and protocol.....	387
20.2.2 Reference FE model.....	387
20.2.3 Computational cost of the high-fidelity model.....	389
20.3 Materials and methods.....	389
20.3.1 Dictionaries of local reduced-order models: method overview.....	389
20.3.2 Data pruning of the high-fidelity models of the training set using a submodeling scheme.....	390
20.3.3 Statistical shape modelling using principal component analysis.....	391
20.3.4 K-medoid clustering and visualization.....	391
20.3.5 Definition of the validation dataset.....	393
20.3.6 Construction of local reduced-order basis to represent the strain localization.....	393
20.3.7 Data augmentation by oversampling around representative digital twins	393
20.3.8 Cleaning dataset obtained from data augmentation.....	394
20.3.9 Training of a classifier.....	394
20.3.10 Evaluation of the performance of the proposed ROM-net method.....	394
20.4 Results.....	395
20.4.1 K-medoid clustering of the augmented data.....	395
20.4.2 Confusion matrices.....	396
20.4.3 Computational times and error.....	396
20.5 Discussion.....	396
Conflict of interest.....	399
Acknowledgment.....	399
References.....	399
CHAPTER 21 Reduced order modeling of the cardiac function across the scales.....	403
<i>Ludovica Cicci, Stefania Fresca, Elena Zappon, Stefano Pagani, Francesco Regazzoni, Luca Dede', Andrea Manzoni, and Alfio Quarteroni</i>	
21.1 Describing the cardiovascular system: why do we need reduction.....	403

21.2	Cardiac mathematical modeling.....	405
21.2.1	Cardiac mechanics.....	406
21.2.2	Cardiac electrophysiology.....	409
21.2.3	Active force generation.....	411
21.3	Reduced order modeling tools.....	413
21.3.1	Cardiac mechanics.....	414
21.3.2	Cardiac electrophysiology.....	415
21.3.3	Active force generation.....	418
21.4	Numerical results.....	419
21.4.1	Cardiac mechanics: left ventricle cardiac cycle.....	419
21.4.2	Cardiac electrophysiology.....	420
21.4.3	Active force generation.....	426
21.5	Outlook.....	429
	References.....	429
CHAPTER 22	Surgery simulators based on model-order reduction.....	435
	<i>Carlos Quesada, Alberto Badías, David González, Icíar Alfaro,</i>	
	<i>Francisco Chinesta, and Elías Cueto</i>	
22.1	Introduction.....	435
22.2	The naive approach to reduced-order modeling of surgery.....	436
22.3	A proper generalized decomposition approach.....	439
22.4	Physics-based augmented reality in surgery.....	442
22.5	Towards digital human twins.....	446
22.6	Conclusions.....	450
	References.....	450
